Keynote Speech 1
The path to which the 5G takes us, from the atom to the direct communication between devices and machines

Prof. Jose F. Monserrat
Universitat Politècnica de València (UPV), Spain

Abstract: This keynote speech analyses the current positioning of vendors and operators concerning the mobile market and its evolution towards the 5G. The seminar will deal with the analysis of the Mobile World Congress 2017, focusing then in the 5G process and the last advances in 3GPP specifications. Special attention will be paid to the D2D and mmW communication topic and the last advances in the research conducted in Prof. Monserrat group.

Biography: Dr.-Ing. Jose F. Monserrat received his MSc. degree with High Honors and Ph.D. degree in Telecommunications engineering from the Universitat Politècnica de València (UPV) in 2003 and 2007, respectively. He was the recipient of the First Regional Prize of Engineering Studies in 2003 for his outstanding student record receiving also the Best Thesis Prize from the UPV in 2008. In 2009 he was awarded with the best young researcher prize of Valencia. In 2016 he received the merit medal from the Spanish royal academy of engineering, in the young researcher category. He is currently an associate professor in the Communications Department of the UPV. His current research focuses on the design of future 5G wireless systems and their performance assessment. He has been involved in several European Projects, being especially significant his participation in NEWCOM, PROSIMOS, WINNER+ and METIS/METIS-II where he led the simulation activities. He also participated in 2010 in one external evaluation group within ITU-R on the performance assessment of the candidates for the future family of standards IMT-Advanced. He co-edited two special issues in IEEE Communications Magazine on IMT-Advanced and 5G technologies and is co-editor of the Wiley book “Mobile and wireless communications for IMT-Advanced and beyond” and the Cambridge book “5G Mobile and Wireless Communications Technology”. Jose Monserrat is senior member of the IEEE, manages around 0.5 M€ yearly budget, holds 6 patents and has published more than 50 journal papers. Currently the group headed by Prof. Jose F. Monserrat consists of 5 Postdoctoral fellows, 8 PhD students and 2 Master students.
Keynote Speech 2
Attribute-Based Access Control Status and Directions

Prof. Indrakshi Ray
Colorado State University, USA

Abstract: This keynote speech analyses the current positioning of vendors and operators concerning the mobile market and its evolution towards the 5G. The seminar will deal with the analysis of the Mobile World Congress 2017, focusing then in the 5G process and the last advances in 3GPP specifications. Special attention will be paid to the D2D and mmW communication topic and the last advances in the research conducted in Prof. Monserrat group.

Biography: Indrakshi Ray is a Professor in the Computer Science Department at Colorado State University. She has been a visiting faculty at Air Force Research Laboratory, Naval Research Laboratory, and at INRIA, Rocquencourt, France. She obtained her Ph.D. in Information Technology from George Mason University. Dr. Ray's research interests include security and privacy, database systems, and formal methods for software assurance. She is on the editorial board of IEEE Transactions on Dependable and Secure Computing and Computer Standards and Interfaces. She has been a guest editor of ACM Transactions of Information Systems Security and Journal of Digital Library. She was the Program Chair of ACM SACMAT 2006, Program Co-Chair for ICISS 2013, CSS 2013, IFIP DBSec 2003, and General Chair of SACMAT 2008.
Keynote Speech 3
QoS-aware deployment of Fog applications

Prof. Antonio Brogi
University of Pisa, Italy

Abstract: Deploying composite applications over Fog infrastructures is challenging due to the heterogeneity and scale of such infrastructures. Application components must be provided with the software and hardware capabilities they need, while communications should meet the desired QoS (e.g., latency and bandwidth). On the other hand, different Fog and Cloud nodes provide different software and hardware capabilities, and actual communication links support different QoS over time. In this talk we will discuss some of the problems of determining how to “best” deploy composite applications over Fog infrastructures, and the benefits of automated tools capable of supporting human-driven application management at the edge.

Biography: Antonio Brogi is full professor at the Department of Computer Science, University of Pisa, Italy, since 2004. His research interests include service-oriented, cloud and fog computing, coordination and adaptation of software elements, formal methods, and design of programming languages. He has published the results of his research in over 150 papers in international journals and conferences. He is member of the editorial board of the journal “Computer Languages, Systems and Structures”, of the steering committee of the ClbSE, ESOCC, and FOCLASA conference series, and he has participated in the program committee of a number of international conferences and workshops in his areas of research. He has been participating in various international and national research projects, both as project leader and as principal investigator for his University. He recently coordinated the UNIPI-PRA-2016-64 project “Through the fog” and participated as principal investigator for UNIPI in the EU-FP7-ICT-610531 project “SeaClouds -Seamless adaptive multi-cloud management of service-based applications”.

Keynote Speech 4
Smart Multimedia Services Distribution Using Software Defined Adaptive Cognitive Networks

Prof. Jaime Lloret
Universitat Politècnica de València (UPV), Spain

Abstract: Current networks have much limitations due to their rigidity, which is given by static configurations mainly based on commands or static scripts. The resource provisioning is less automatic and the efficiency decreases. Moreover, virtualization and cloud are changing radically the traffic patterns of the data center. This is mainly due to the communication between servers, because the applications are split in many virtual machines that must communicate. Software Defined Networks (SDNs) are able to divide the control plane from the data plane, which allow higher programmable, automatic and flexible networks. In SDNs, we do not need to program node by node, but by a centralized manner through software that can be implemented independently of the manufacturer or the model (if they are supporting the same communication protocol). SDNs provide a more open network and allow accessing better to certain intelligent functions, which can contribute higher intelligence to the network operating. These features make SDNs ideal to have a system that is able to adapt with the aim of having higher performance. Cognitive networks use the information gathered from the network, such as observing traffic patterns for different network devices or the used protocols, the behavior of the users and servers, and the additional information that can be taken from the wireless networks (user movement, location, etc.), in order to implement a series of procedures. In order to achieve this goal, artificial intelligence and automatic learning will be used over the available information. This will allow improving a specific objective and achieve higher system performance. This speech will show the steps performed in a cooperative project where we designed and developed a network architecture and the communication protocol, that use the cognitive information taken from the data frames, the users and servers behavior, and the traffic patterns (traffic changes, quality of service parameters, state of the frames, etc.) with the aim of improving the multimedia delivery performance. The designed network is able to self adapt in each case. Network devices gather network parameters and patters that are used by a smart network algorithm to evolve behaviors based on the empirical data. The cognitive adaptive software defined network can be implemented in a wide range of multimedia applications.

Biography: Prof. Jaime Lloret (jlloret@dcom.upv.es) received his M.Sc. in Physics in 1997, his M.Sc. in electronic Engineering in 2003 and his Ph.D. in telecommunication engineering (Dr. Ing.) in 2006. He is a Cisco Certified Network Professional Instructor. He worked as a network designer and administrator in several enterprises. He is currently Associate Professor in the Polytechnic University of Valencia.
